

Fig. Qualitative results of our generated proposals on THUMOS14. The results show the top 10 proposals. The top one Demonstrates the re-ranking network can improve the performance, by reducing the confidence score of the inappropriate candidate proposals. The performance of the bottom one is not very good, but it also can be found that the proposal with a high overlap with GT will get a higher confidence score after re-ranking (eg: 69.7s-78.1s).
